MEASUREMENTS AND CAPACITIES

These measurements and capacities should be used in conjunction with the venue floor plans, to account for irregular room shapes. Length and width measurements are taken from largest measurements of any given space.

The total capacity of the venue must not be calculated by adding all standing capacities together, due to final fire exit locations & widths. Any event total capacity will depend on spaces in use, and other activity within the venue at any given time. Your Account Manager will be able to assist with this calculation.

TDVL will be happy to put you in touch with one of our preferred Health & Safety consultants should you require any additional support with capacity calculations and the associated control measures or general event safety consultancy.

Please note, whilst all stated capacities are based on achievable layouts (sample plans available on request), all events are unique and as such capacities must be properly calculated and published in the associated Event Management Safety Plan compiled by a competent person for each event based on the planned layout.

Height to beam / Theatre based on Olympus chair / Cabaret based on 8 per 5ft table / Banqueting includes provision for a stage, 10 per 5ft round / Standing fire capacity in empty space

* Higher capacity is available as per Horner Salus fire capacities based on fire exit routes, however, TDVL do not recommend a higher capacity than shown in these cases due to guest comfort.

** From 28th May - 4th October 2024 capacities within brackets will be in effect due to our temporary cooling installation.
